## Scientists collaborate over COVID-19 Data Portal to speed up vaccine

📅 26th August 2020  
🏢 [European Open Science Cloud](#)  
👤 Lanna Cooper

**More than 73,000 users collaborate on new online platform set up by the European Open Science Cloud Initiative, where scientists share COVID-19 data and accelerate our understanding of the virus to help develop treatments and vaccines quicker.**

A new website that allows scientists to share difficult-to-find SARS-CoV-2 data from clinical trials, research centres, hospitals and national healthcare systems, has seen thousands of users collaborating to help beat the novel coronavirus.

### Overcoming Product Lifecycle Challenges

From development to sustainment: the five P's every plan should include.

This white paper will examine the external disruptors that impact an OEM's supply chain and the five "Ps" for effective product lifecycle planning.

Unbounded by red tape or paywalls, the new [European COVID-19 Data Platform](#) - an open, digital space for researchers to share and upload data sets - has seen more than 73 thousand users to the platform, and 2.6 million requests since its launch on 20th April of this year.

Gathering clinical information, the Data Portal brings together relevant datasets that are very difficult to find, such as raw and assembled viral sequences.

While scientists across the world have worked on COVID-19 as a national imperative, a big challenge for researchers in the fast-moving situation has been the sharing of data and findings in a coordinated way.

But now, thanks to this new platform, thousands of researchers are already sharing free resources to tackle COVID-19 in the context of the [European Open Science Cloud initiative \(EOSC\)](#).

Seeing global research collaborations, the Portal has a wide spread of nations with the majority of its users coming from the UK (12%), the USA (9%), Spain (8%), Italy (8%) and Germany (7%).

Set up by the European Molecular Biology Laboratory's European Bioinformatics Institute (EMBL-EBI) and the European research infrastructure ELIXIR, the platform is supporting life science laboratories across Europe to share and store their research data.

## Coordinated

Generating enormous amounts of data from clinical trials, research centres, hospitals and national healthcare systems on the disease, the COVID-19 Data Portal has successfully coordinated the data since the pandemic began spreading in early February 2020.

Project Co-ordinator of EOSC-Life, Niklas Blomberg said: "We are really impressed with the rapid uptake of the portal.

"Already we are seeing the platform play a key role in allowing scientists to understand fundamental questions about the virus. Researchers are sharing knowledge on how the virus mutates when spreading, the basic biology of the virus, how it infects, whether there are any drug targets or intervention points where known drugs can be repurposed, and the human response, for example, the genetic risk factors for the severity of the disease.

"The work in EOSC-Life on Europe-wide solutions for federated access to data that cannot be openly shared - for example, human genomes and disease data, data from clinical trials, access to biobank samples from European biobanks - is directly supporting the portal development. The work provides a blueprint for long term solutions and potentially helps to prepare us for future outbreaks."

## Federation of data

Blomberg believes this will pave the way for a federated model - a multi-layered federation of data supplying a wide range of publicly-funded services at national, regional and institutional levels.
